

CHronoZ

MACRO INTELLIGENCE AGENT

System Architecture, Economic World Model & Compounding Research Memory

A technical whitepaper defining the founder-approved baseline for CHronoZ: a temporal, evidence-grounded macro research agent designed to transform multimodal research dumps into structured intelligence, readable journals, and a progressively compounding knowledge base.

CANONICAL BASELINE

Status: Founder-approved conceptual model. This document is the working specification to be translated into TypeScript, Wonny integration, and agent prompts. It is a design document, not investment advice.

v0.1 / QuantFun × Wonny / September 2026

Abstract

CHronoZ is a temporal macro intelligence agent whose purpose is to convert scattered research evidence into a coherent, auditable, and continuously evolving macro worldview. It accepts multimodal local research inputs - including Markdown, PDF, PNG/JPG screenshots, charts, tables, qualitative notes, descriptive research and headline material - and processes them through a layered agentic workflow before producing a dated Markdown Macro Journal and a printable document.

The defining design choice is that CHronoZ does not reason from a blank page. New evidence is evaluated against a Current Default Economic State: a structured multi-paradigm model of the real economy, inflation, credit, policy, financial conditions, external conditions, debt cycle, structural productivity and time horizon. Findings are mapped to economic nodes, evaluated for impact, propagated through explicit transmission channels, tested as causal hypotheses, compared against expectations and market pricing, challenged by a critic, and only then compressed into a regime thesis and journal narrative.

Librarian acts as the memory gatekeeper between CHronoZ and the Wonnyy Knowledge Vault. Markdown is the canonical human-readable knowledge artifact; PDF is a presentation layer. Each run becomes historical context for subsequent runs, allowing economic state, themes, assumptions and thesis evolution to compound through time.

CONTENTS

- 1. Product thesis and design principles
- 2. Founder-approved final architecture
- 3. Three-layer agentic workflow
- 4. Economic Paradigm Modelling
- 5. Current Default Economic State
- 6. Transmission, impact and causality
- 7. Expectations, pricing and cross-asset interpretation
- 8. Thesis, falsification and journal synthesis
- 9. Librarian and compounding knowledge memory
- 10. Core data model and technical architecture
- 11. Input/output contract and run lifecycle
- 12. Implementation roadmap
- 13. Epistemic discipline and failure modes
- Appendix A. TypeScript object contracts
- Appendix B. Initial transmission graph

1. Product Thesis

Macro research is rarely born from one clean dataset. In practice, useful information arrives as screenshots, charts, analyst notes, PDFs, tables, news fragments, qualitative observations and market pricing. The research problem is therefore not merely data retrieval. It is the transformation of heterogeneous evidence into a structured worldview that can be revisited, challenged, compared through time and stored as institutional memory.

The weak pattern

Raw input → LLM prompt → plausible-sounding narrative.
This is fast, but it hides provenance, state assumptions, transmission mechanisms and uncertainty.

The CHronoZ pattern

Raw input → evidence → findings → economic state → impact → transmission → causal hypothesis → expectations/pricing → thesis → critique → journal → memory.

Design principles

- CHronoZ does not reason from a blank page; every run begins from a Current Default Economic State.
- Evidence updates the model; it does not automatically replace the model.
- Qualitative and descriptive evidence are first-class inputs, not second-class substitutes for numeric data.
- Correlation is not treated as causal proof. CHronoZ produces causal hypotheses and grades their support.
- Causality is state-dependent: the same shock may transmit differently under different balance-sheet, policy and liquidity conditions.
- Regime labels are compression devices, not substitutes for the underlying state.
- Markdown is the canonical knowledge artifact; rendered PDF is a presentation layer.
- Librarian, not every agent, controls read/write interaction with the broader Wonny Knowledge Vault.
- Historical journals remain immutable so prior beliefs, mistakes and thesis evolution can be audited.

2. Founder-Approved Final Architecture

The canonical CHronoZ model is organized as three conceptual layers - Information, Processing and Interpretation - coordinated as an agentic research workflow and connected to Librarian for memory.

Figure 1. Founder architecture sketch - canonical conceptual flow.

```

RAW INPUT
↓
[1] File-to-Text / Multimodal Extraction

```

Important boundary

CHronoZ may request selected historical context from Librarian and submit final knowledge artifacts back to Librarian. CHronoZ should not receive unrestricted authority to mutate the entire Wonny Vault.

3. Three-Layer Agentic Workflow

Layer 1 - Information

The objective is to convert heterogeneous research material into normalized, traceable information without prematurely forming a macro thesis.

- [1] File-to-Text / Multimodal Extraction: reads Markdown, PDF and images; extracts text, chart meaning, dates, entities, claims and numbers while preserving source provenance.
- [2] Macro Information Classifier: maps each finding to one or more macro concepts such as labor, growth, credit, policy, inflation, liquidity or cross-asset relevance.
- [3] Base Macro Data Information: constructs a normalized set of EvidenceItem and Finding objects for downstream reasoning.

Cold evidence rule

Layer 1 should be intentionally "cold." The Evidence Agent is not rewarded for sounding insightful. Its job is to represent what the material actually says and where that information came from.

Layer 2 - Processing

This layer converts information into an economic interpretation by evaluating it against the internal world model.

- [4] Economic Paradigm Modelling: anchors all interpretation to the Current Default Economic State and the Economic Transmission Graph.
- [5] Web / External Data Pull: an optional research tool called only when additional validation or missing context is needed.
- [6] Causality Analysis: constructs and grades causal hypotheses rather than asserting causal truth from heterogeneous evidence.
- [7] Expectations & Pricing: compares economic reality with consensus expectations and what markets already appear to discount.

Layer 3 - Interpretation

- [8] Cross-Asset Interpreter: checks whether rates, FX, credit, equities, commodities, gold and other relevant assets confirm or contradict the economic thesis.
- [9] Thesis / Regime Agent: compresses many findings into a small number of dominant themes and a current macro regime view.
- [10] Critic / Falsification Agent: attacks the thesis, identifies fragile assumptions, competing explanations, contradictory evidence and falsifiers.
- [11] Journal Synthesizer: packages the approved research state into a dated, readable Macro Journal and machine-consumable state summary.

4. Economic Paradigm Modelling

Economic Paradigm Modelling is the economic operating model inside CHronoZ. It is designed to prevent random narrative reasoning by giving every new finding a structured baseline, a set of recognized economic concepts and an explicit map of plausible transmission mechanisms.

4.1 Multi-paradigm philosophy

No single school of macroeconomics is treated as absolute. CHronoZ uses several lenses as competing explanatory frameworks and lets the evidence determine which mechanisms are most relevant.

Keynesian: Demand, fiscal impulse, output gap and aggregate spending.

Monetary: Money, inflation dynamics and policy stance.

New Keynesian: Expectations, wages, persistence and policy reaction functions.

Balance-sheet / Dalio-inspired: Debt, leverage, credit, refinancing, liquidity and cyclical balance-sheet feedback.

Supply-side: Productivity, labor supply, capacity, capital formation and technology.

Open-economy: FX, trade, import prices, capital flows and global dollar conditions.

Market-based macro: Expectations, pricing, positioning, risk appetite and cross-asset confirmation.

Dalio-like in spirit, not dogma

CHronoZ borrows the useful systems intuition of debt, credit, balance sheets and feedback loops, but it does not force every economy into a single debt-cycle narrative. The model is explicitly multi-paradigm.

5. Economic State Architecture

The Current Default Economic State is decomposed into interconnected subsystems. The initial V0 set is deliberately broad enough to capture real-world qualitative research while still being tractable in code.

4A. Real Economy

Growth, consumption, investment, production, labor, income and productivity.

4B. Inflation & Price System

Headline inflation, core inflation, wages, commodities, import prices and inflation expectations.

4C. Credit & Balance Sheet

Credit growth, lending standards, debt service, leverage, household/corporate balance sheets, banking conditions and refinancing stress.

4D. Policy System

Monetary policy, fiscal policy, regulatory/credit policy, FX intervention and liquidity provision.

4E. Financial Conditions

Rates, yield curve, credit spreads, equities, FX, liquidity, volatility and funding conditions.

4F. External / Global

Trade, current account, capital flows, commodity exposure, dollar conditions, foreign demand and global liquidity.

4G. Debt Cycle

Credit expansion, leverage build-up, late-cycle tightening, debt stress, deleveraging and repair.

4H. Structural / Productivity

Productivity, technology adoption, demographics, capital formation, labor supply, infrastructure and institutional capacity.

4I. Time Horizon

Short-term 0-12m, medium-term 1-5y and long-term 5-20+y drivers are kept distinct.

4J-4N. State, Transmission, Impact, Causality & Regime

The dynamic components that let evidence change the model through disciplined reasoning rather than free-form narration.

6. Current Default Economic State

The Current Default State is the baseline against which every new input is measured. It is not a static dashboard; it is a stateful model that evolves from t0 to t1, t2 and beyond as evidence accumulates.

```
EconomicStateNode
├─ name
├─ level
├─ direction
├─ momentum
├─ confidence
└─ lastUpdated
```

Level, direction, momentum and surprise

CHronoZ must distinguish the absolute condition of a variable from its direction of travel. Markets frequently respond to changes in direction, acceleration and surprise rather than the level alone.

Example: unemployment

Level: 4.3%
Direction: rising
Momentum: rise accelerating
Surprise: above consensus

Example: inflation

Level: 3.0%
Direction: falling
Momentum: disinflation slowing
Consensus: 2.8%
Surprise: +0.2pp

In discrete time, the first change can be represented as $\Delta x_t = x_t - x_{t-1}$. A change in Δx provides a practical approximation of acceleration. This gives CHronoZ a natural bridge to statistics and calculus without pretending monthly macro data are continuous.

State transition rule

A weak single observation should rarely flip a regime. Low-confidence evidence may update notes or confidence; stronger and persistent evidence may change direction, momentum or level; only accumulated material changes should be allowed to shift the regime.

7. Economic Transmission Graph

The Economic Transmission Graph defines plausible relationships between economic nodes. It constrains the reasoning space so that CHronoZ does not invent arbitrary causal stories every run.

```

Policy Rate ↑
  ↓
Borrowing Cost ↑
  ↓
Credit Demand ↓
  ↓
Consumption / Investment ↓
  ↓
Aggregate Demand ↓
  ↓
Growth ↓
  ↓
Labor Demand ↓
  ↓
Wage Pressure ↓
  ↓
Inflation ↓

```

```

Liquidity ↑
  ↓
Asset Prices ↑
  ↓
Financial Conditions Ease
  ↓
Credit / Spending ↑
  ↓
Growth ↑

```

Edge metadata

Each relationship should eventually contain metadata such as sign, expected lag, base strength, mechanism and state modifiers.

```

PolicyRate → CreditGrowth
sign: negative
lag: medium
baseStrength: moderate
mechanism: higher borrowing costs reduce credit demand
stateModifiers: high leverage, refinancing need, bank balance-sheet weakness

```

If an LLM proposes a relationship outside the registered map, the output should be marked as an UNMODELED HYPOTHESIS rather than silently treated as established.

8. Impact Assessment & Causal Hypotheses

CHronoZ does not claim statistical causal proof from screenshots, research notes or mixed qualitative inputs. It builds causal hypotheses and grades how well the available evidence supports them.

8.1 Four levels of impact

- 1. Direct effect:** The finding directly changes a target node.
- 2. First-order effect:** The target node affects an adjacent node through a known transmission channel.
- 3. Second-order effect:** The effect spreads through another link or feedback loop.
- 4. Regime effect:** The accumulated change is large and persistent enough to alter the compressed macro regime.

```
Oil +20%
  ↓ direct
Energy Price Pressure ↑
  ↓ first-order
Headline Inflation ↑
  ↓ second-order
Real Income ↓ → Consumption ↓
  ↓ possible regime effect
Disinflationary slowdown → stagflationary risk
```

8.2 Causal evaluation test

1. Mechanism - Is there a plausible economic transmission mechanism?
2. Temporal order - Did the proposed cause precede the proposed effect?
3. Supporting evidence - Is there independent evidence consistent with the mechanism?
4. Alternative explanation - What competing hypotheses could explain the same finding?
5. Contradictory evidence - What relevant evidence does not fit the proposed story?

No fake precision

Until CHronoZ has a statistically defensible model, causal confidence should be graded qualitatively or on an evidence-support scale. A number such as 83.72% should not be emitted merely because it looks quantitative.

9. State-Dependent Causality

The same economic shock can transmit very differently depending on the starting state. This is why the Current Default State is not optional infrastructure; it is required for impact interpretation.

Economy A

Debt: low
Growth: strong
Credit: easy
Refinancing stress: low

Economy B

Debt: high
Growth: weak
Credit: tight
Refinancing stress: high

A +25bp policy shock may be modest in Economy A but materially contractionary in Economy B. Conceptually:

$$\text{Impact} = f(\text{Event, Current State, Transmission Strength, Lag})$$

This function is initially conceptual rather than numerically estimated. Over time, CHronoZ may calibrate transmission strengths using historical state trajectories, outcomes and statistical models.

10. Expectations, Pricing & Cross-Asset Interpretation

Economic reality is not equivalent to market opportunity. Markets trade the difference between what happens, what was expected and what is already priced. CHronoZ therefore separates economic modelling from expectations and asset-pricing interpretation.

ECONOMIC REALITY
VS
CONSENSUS EXPECTATION
VS
MARKET PRICING

Example: labor data may weaken enough to justify easier monetary policy, yet rates may already discount a large easing cycle. In that case, "labor weak → bonds bullish" is an incomplete conclusion. The research question becomes whether the deterioration is faster or more severe than what the market already prices.

Cross-asset confirmation

The Cross-Asset Interpreter checks whether market behavior is consistent with the thesis. Rates, FX, gold, credit spreads, equities, commodities and liquidity-sensitive assets may provide confirmation or divergence.

Illustrative insight

Bond and FX markets may confirm easier-policy expectations while tight credit spreads and resilient equities imply that markets are not pricing a severe recession. The contradiction itself can be more informative than any single asset move.

11. Thesis, Regime, Falsification & Journal

Thesis / Regime Agent

The Thesis Agent performs compression. It converts dozens of findings, state changes and causal hypotheses into a small number of dominant themes and a nuanced regime view. Themes should have lifecycle states such as Emerging, Strengthening, Stable, Weakening and Invalidated.

Critic / Falsification Agent

The Critic is mandatory. It asks what contradicts the thesis, what assumptions are fragile, what alternative regime could explain the same evidence and what future observation would invalidate the current view.

Thesis: soft landing + easing

Contradiction:
services inflation remains sticky

Alternative explanation:
labor slowdown may be normalization rather than recessionary deterioration

Falsifier:
renewed wage acceleration + stronger PMIs

Journal Synthesizer

The Journal Synthesizer should not invent new macro reasoning. Its job is to package the approved research state into a readable dated artifact.

- Macro overview
- Dominant themes
- What changed
- Current economic state
- Causal hypotheses
- Market expectations and divergences
- Contradictions and uncertainties
- Current regime / thesis
- Watchlist
- Source provenance

12. Librarian & Compounding Knowledge Memory

Librarian is a separate knowledge infrastructure agent. CHronoZ produces research; Librarian governs how that research is stored, indexed, retrieved and reintroduced into future context.

Canonical artifact policy

Markdown

Canonical human-readable knowledge source. Immutable historical journal, metadata, narrative, provenance and visual references.

Machine state

Compact JSON representation such as latest.json. Used so future runs do not have to reconstruct every state variable by rereading prose.

PDF is generated from the same knowledge artifact for end-use reading and printing. It is not a second, independent source of truth.

13. Core Data Model & Technical Architecture

CHronoZ V0 is intentionally designed as a TypeScript/Node.js system that can later be integrated into the existing Wonnyy Electron environment. AI models assist extraction and reasoning, but system state, object contracts and storage boundaries remain explicit in code.

14. Tech Stack, Input & Output Contract

Component	V0 decision
Language	TypeScript
Runtime	Node.js inside the Wonnyy/Electron environment
UI	Existing React / Next.js Wonnyy interface
Input	Local PNG/JPG, PDF and Markdown paths; tables/charts may arrive through those formats
Working state	TypeScript objects / JSON
Reasoning	Existing configurable LLM provider layer
Canonical output	Dated Markdown Macro Journal
Machine memory	Compact JSON current state
Storage	Wonnyy local Vault via Librarian
Printable output	Markdown → HTML / print renderer → PDF
Later extensions	Web/API tools, statistics/time-series, optional Python where genuinely useful
V0 scope control Do not begin with vector databases, autonomous browsing, schedulers, many micro-agents or a Python service. The first objective is a correct economic state model and deterministic data flow that the developer can understand line by line.	

15. One CHronoZ Run

1. Receive local research dump.
2. Normalize each source into EvidenceItem objects.
3. Extract Findings while preserving provenance.
4. Classify findings against the economic ontology.
5. Load the latest Current Default Economic State from memory.
6. Assess direct impact of each relevant finding.
7. Use the transmission graph to identify plausible first- and second-order effects.
8. Generate causal hypotheses and competing explanations.
9. Optionally request missing evidence through external research tools.
10. Compare reality with consensus expectations and market pricing.
11. Update the economic state only when evidence is sufficiently strong.
12. Compress the state into themes and a regime thesis.
13. Run the Critic / Falsification Agent.
14. Synthesize the dated Markdown journal.
15. Send the canonical artifact and compact state to Librarian.
16. Render the Markdown into a printable PDF for end-use.
17. Use the resulting journal and state as historical context in the next run.

16. Implementation Roadmap

M0 - Skeleton

index.ts, TypeScript runtime, console output, basic objects and arrays.

M1 - Economic Node

Define EconomicStateNode and manually create Growth, Inflation, Labor, Credit and Policy nodes.

M2 - Current Economic State

Create structured default-state.ts / JSON. No AI.

M3 - Findings

Represent new macro information using typed Finding objects.

M4 - Impact Assessment

Manually map findings to nodes, direction, strength, lag and confidence.

M5 - Transmission Map

Start with 5-10 explicit relationships such as Policy → Credit → Investment → Growth → Labor → Wages → Inflation.

M6 - State Update

Allow sufficiently strong evidence to change the default state.

M7 - Causal Hypotheses

Represent mechanism, temporal fit, supporting/contradictory evidence and alternatives.

M8 - Regime Compression

Generate a readable macro regime from the state.

M9 - Markdown

Generate the first dated CHronoZ Macro Journal.

M10 - LLM Integration

Use the configured model provider for extraction, classification, causal reasoning and narrative writing while preserving typed contracts.

M11 - Librarian / Wonny Integration

Route canonical artifacts and state through the memory gatekeeper into the Vault.

17. Epistemic Discipline & Failure Modes

The quality of CHronoZ should be judged by the integrity of its reasoning chain, not by how confident or eloquent its prose sounds.

Narrative hallucination - Mitigation: preserve provenance; make Layer 1 cold; require findings before interpretation.

Single-data-point overreaction - Mitigation: state-transition thresholds, confidence and historical context.

Correlation treated as causation - Mitigation: mechanism, temporal order, alternatives and contradictory-evidence checks.

Regime label anchoring - Mitigation: retain full state below the regime compression.

Market implication without pricing context - Mitigation: expectations and pricing layer before investment interpretation.

Memory contamination - Mitigation: immutable journals; Librarian-controlled indexing; compact machine state separated from prose.

Pseudo-quantification - Mitigation: no precise numeric confidence without defensible statistical calibration.

Theory monoculture - Mitigation: multi-paradigm lenses and competing causal hypotheses.

Agent sprawl - Mitigation: begin with a small number of functional agents and split only when a real bottleneck appears.

Insight quality test

A macro output should not be called an insight unless it meaningfully addresses several of the following: What changed? Why does it matter? Why might it be happening? What was expected? What is priced? What confirms it? What contradicts it? What does it imply? What would invalidate it?

18. Long-Term Compounding Advantage

The long-term value of CHronoZ is not merely faster writing. It is the accumulation of a proprietary research history containing evidence, economic states, causal hypotheses, confidence, thesis changes, contradictions and subsequent outcomes.

```
Evidence t0 → State t0 → Thesis t0 → Journal t0
      ↓ time passes
Evidence t1 → State t1 → Thesis t1 → Journal t1
      ↓
Evidence t2 → State t2 → Thesis t2 → Journal t2
      ↓
      ... years ...
```

Over time, this history can support historical state matching, thesis calibration, forecasting evaluation, regime-transition research and quantitative study. The defensible asset is therefore not just the agent prompt. It is the combination of the economic ontology, transmission graph, state history, provenance and accumulated knowledge artifacts.

Appendix A - Initial TypeScript Object Contracts

}
```

Appendix B - Initial Transmission Graph V0

Relationship	Sign	Lag	Mechanism
Policy rates → borrowing cost	positive	short	Changes financing cost across households, firms and banks.
Borrowing cost → credit demand	negative	short-medium	Higher financing cost reduces willingness and ability to borrow.
Credit conditions → investment	positive	medium	Easier credit increases financing availability for capex and working capital.
Credit conditions → consumption	positive	medium	Household financing availability affects durable consumption and housing.
Investment → aggregate demand	positive	short-medium	Capital expenditure directly contributes to demand.
Consumption → aggregate demand	positive	short	Household spending is a major component of demand.
Aggregate demand → growth	positive	short-medium	Stronger spending supports output growth.
Growth → labor demand	positive	medium	Firms typically adjust hiring as demand and output change.
Labor demand → wage pressure	positive	medium	Tighter labor conditions tend to increase bargaining pressure.
Wage pressure → services inflation	positive	medium-long	Labor-intensive services can transmit wage costs into prices.
FX depreciation → import prices	positive	short-medium	A weaker currency raises domestic-currency cost of imported goods.
Commodity prices → headline inflation	positive	short	Energy and food prices can transmit quickly into headline inflation.
Liquidity → asset prices	positive/mixed	short	Liquidity can support risk-taking, but the effect depends on risk and policy context.
Asset prices → financial conditions	positive	short	Higher asset values can ease financing and wealth conditions.
Financial conditions → demand	positive	medium	Easier financing and wealth effects can support spending and investment.
Fiscal impulse → demand	positive	short-medium	Government spending or transfers can support aggregate demand.
External demand → exports	positive	short-medium	Foreign growth affects domestic export demand.
Global dollar tightening → EM financial conditions	negative	short	Stronger dollar and tighter global funding can pressure capital flows and financing conditions.

CHronoZ vo.1 - A more structured way to remember how the world changes.
